NOV 21 2008**

Please replace the paragraph on page 8, lines 1-4 with the following:

--When V2 112 is connected to the source of Q1 202 as shown in FIG. 2, current flow from V2 [[202]] 212 can be prevented by lowering the gate voltage present at Q1 202 to a point where V_{gs} exceeds the necessary threshold for a pinch-off condition to occur. Thus, when the desired voltage source V1 110 is present, it is desirable to have the gate of Q1 202 at zero volts (0V). --
